

ClassCo

VoiceAnnounce[®] Communicator for

ClassCo's VoiceAnnounce[®] Communicator is a new software application for Windows[®] and makes the popular Skype "internet telephone" service easy to use for people when they are away from the computer, and improves access to Skype for people with special needs.

Here's how it works: When a Skype call comes in, the VoiceAnnounce Communicator announces the caller's identity over the computer's speakers, cordless headset, or handset. Users can record custom announcements associated with their Skype contacts, or just let the software's built-in text-to-speech engine announce the contact names automatically. The software also includes speaker-independent speech recognition and listens for commands such as "call", "answer", and "hang-up", providing a voice command interface to Skype's telephony functions as well as the Skype contact list.

Available immediately for OEM distribution.

Attract the huge base of Skype users to your product. Ideal for making cordless headsets work with all Skype features, not just answering calls. OEM services include license validation and clickable desktop advertising inside the application frame.

Features

- Works with SKYPE Internet Telephone service
- Announces Skype contact name or telephone number for incoming calls
"Call from <contact name>"
